Temperature Comparison

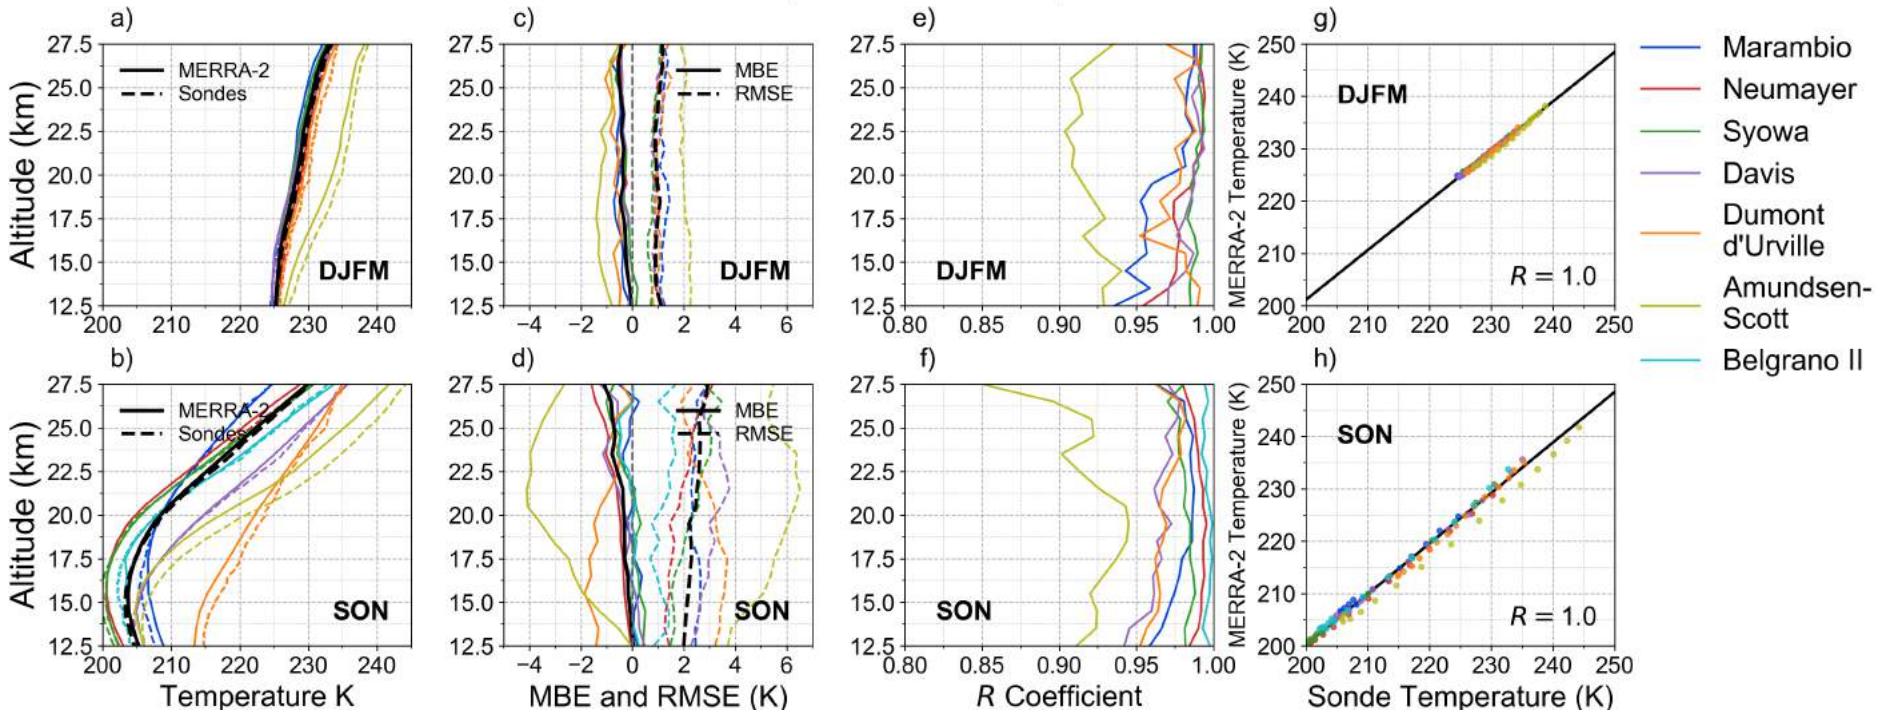

Fig. S1. Comparison between MERRA-2 reanalysis data of the temperature (embedded in OMPS-LP dataset) and balloon-borne measurements of the temperature over the period DJFM 2013-2020 (first row), and over the period SON 2012-2018 (second row).

a-b) Mean profiles measured at each launch site. The solid line stands for the MEAN computed from MERRA-2 temperatures and the dashed line stands for the MEAN computed from balloon-borne measurements of the temperature. 263 and 440 temperature profiles were compared over the periods the DJFM 2013-2020 and SON 2012-2018, respectively;

c-d) Mean Bias Error (*MBE*, solid line) and Root Mean Square Error (*RMSE*, dashed line) relative to balloon-borne temperature data; e-f) *R* profile;

g-h) Scatter plot (the correlation coefficient is shown in the plot).

Neumayer - O_3 Comparison

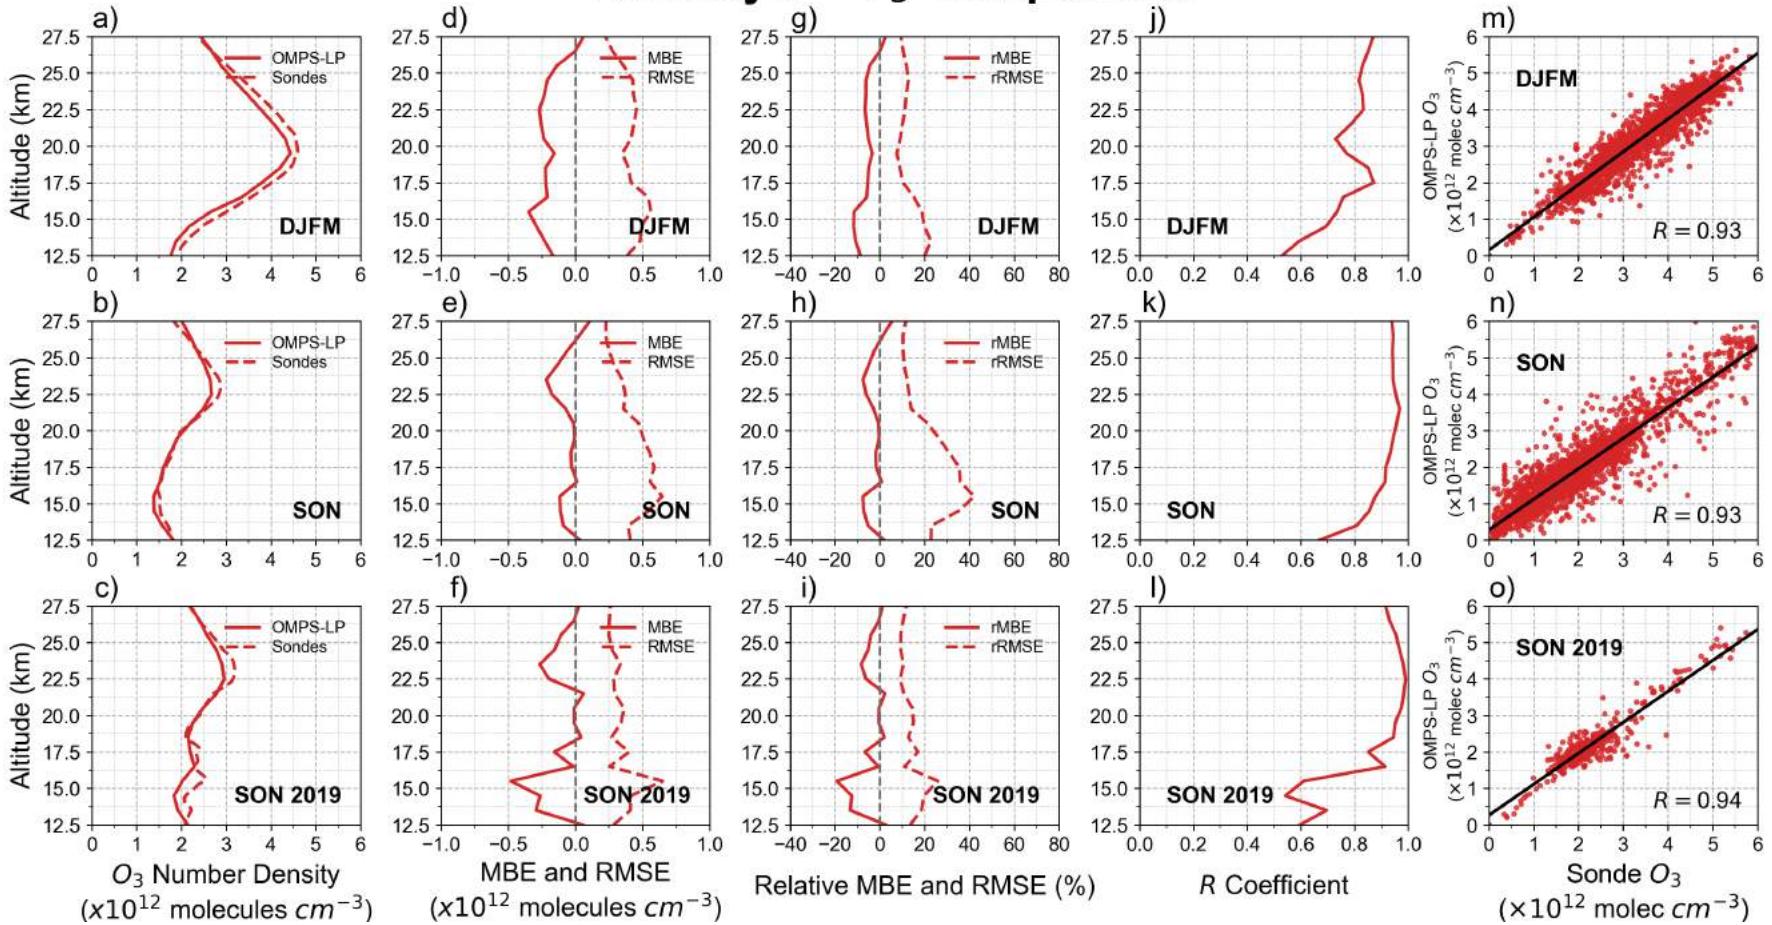

Fig. S2. Comparison between OMPS-LP-derived and balloon-borne data of ozone over the period DJFM 2013-2020 (first row), over the period SON 2012-2018 (second row) and over the period SON 2019 (third row) for Neumayer Station.

a-c) Mean profiles. The solid line stands for the MEAN computed from OMPS-LP-derived data of ozone and the dashed line stands for the MEAN computed from balloon-borne measurements of ozone. 114, 179 and 19 ozone profiles were compared over the periods DJFM 2013-2020, SON 2012-2018 and SON 2019, respectively;

d-f) Mean Bias Error (MBE, solid line) and Root Mean Square Error (RMSE, dashed line) relative to balloon-borne ozone data;

g-i) Relative Mean Bias Error (rMBE, solid line) and Relative Root Mean Square Error (rRMSE, dashed line);

j-l) *R* profile;

m-o) Scatter plot (the correlation coefficient *R* is shown in the plot).

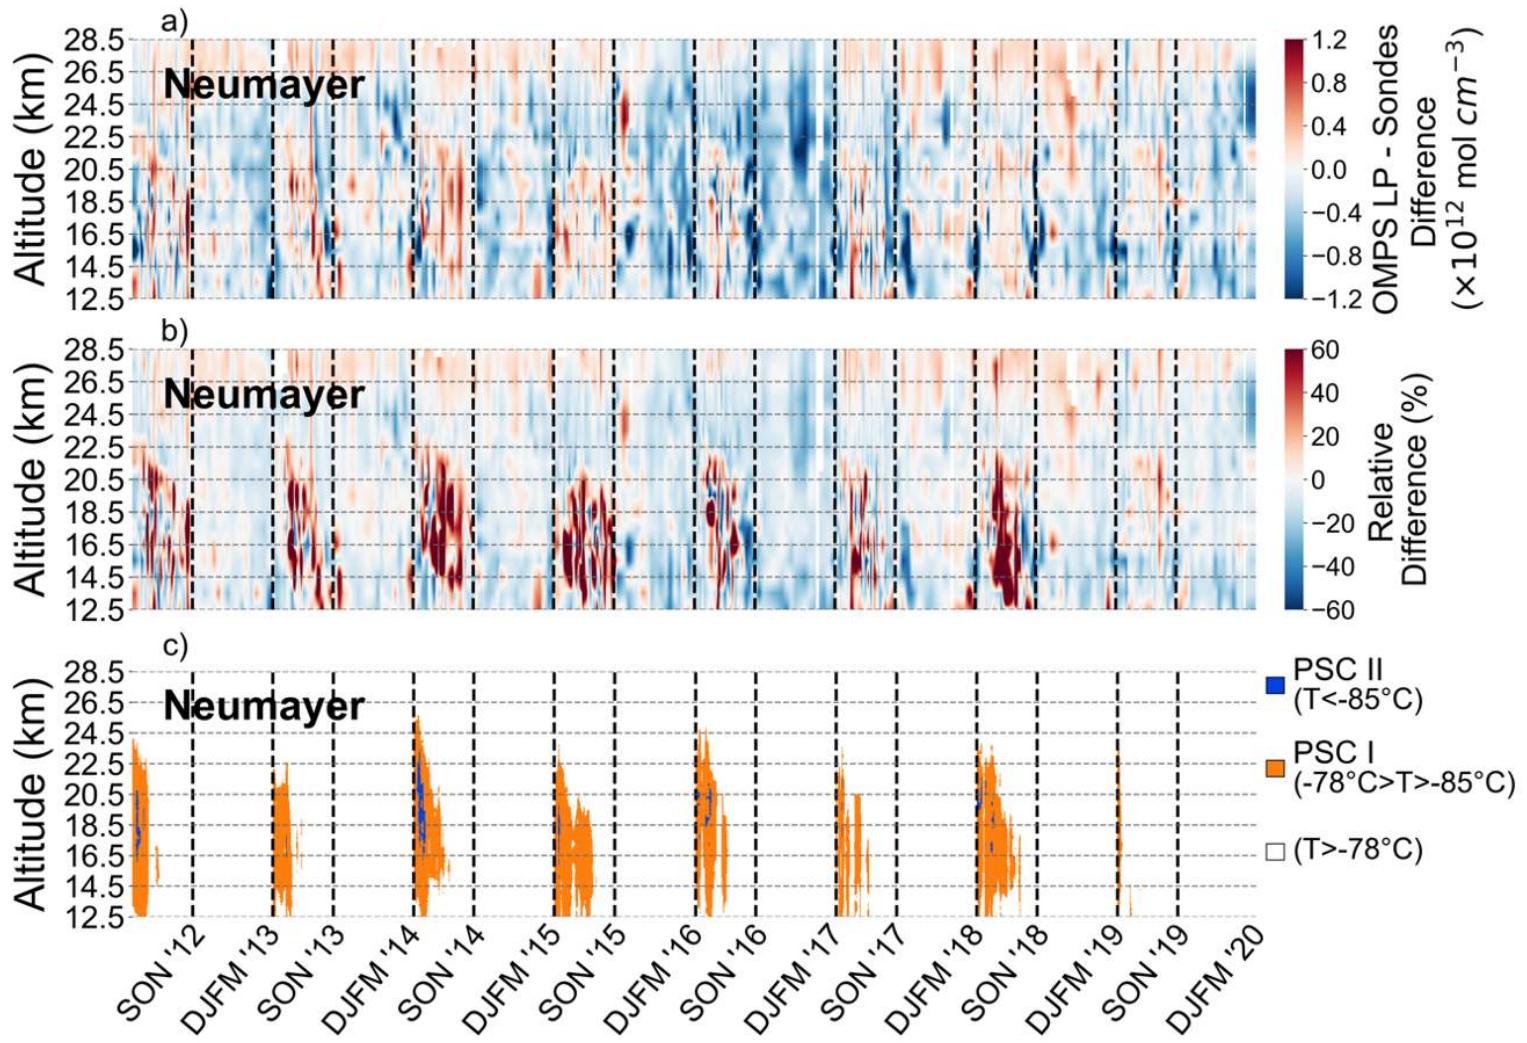

Fig. S3. Heatmap of the differences (absolute and relative) between OMPS-LP-derived estimates and balloon-borne measurements; blank spaces indicates periods within which no sondes fulfilling the comparison criteria were available. Periods and altitudes at which the temperature favors the formation of polar stratospheric clouds (PSC) are shown below the heatmaps; temperature profiles from sondes were used. Dashed lines separate different periods (DJFM and SON).

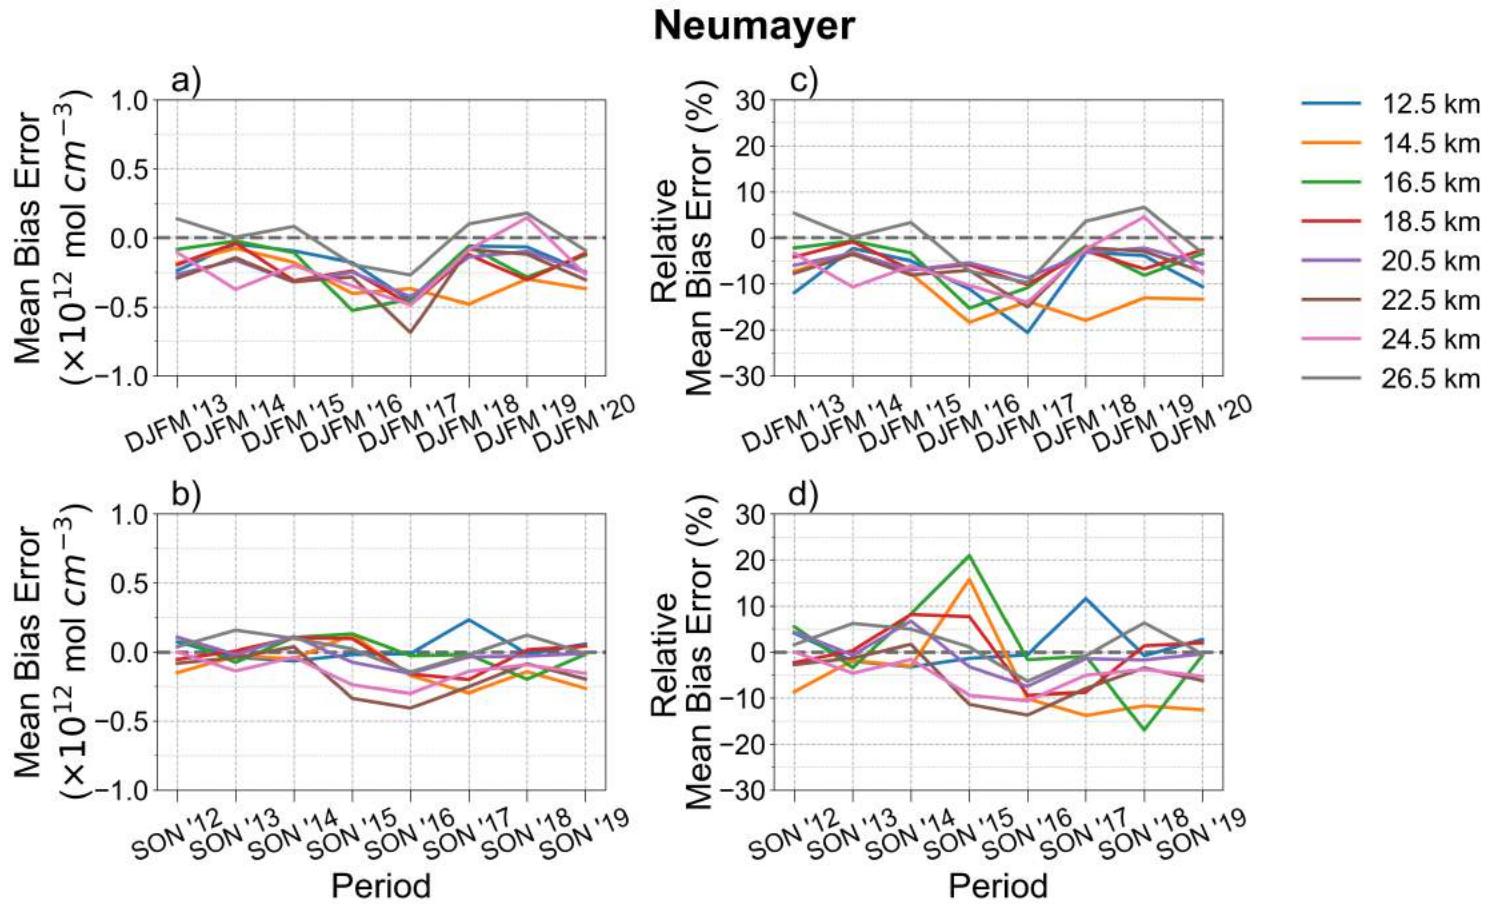

Fig. S4. Time series of the absolute and relative mean bias errors (*MBE*) of OMPS-LP-derived estimates of the ozone (relative to balloon-borne data) computed for Neumayer Station, over the DJFM period (first row) and over the SON period (second row).

Table S1. *R* coefficients between several OMPS-LP parameters (SZA, SSA, Reflectance, etc.) and the relative differences (between the OMPS-LP-derived estimates and the balloon-borne measurements of ozone) over the period DJFM 2013-2020. *R* coefficients higher than 0.2 and lower than -0.2 are in bold.

Dumont d'Urville - O_3 Comparison

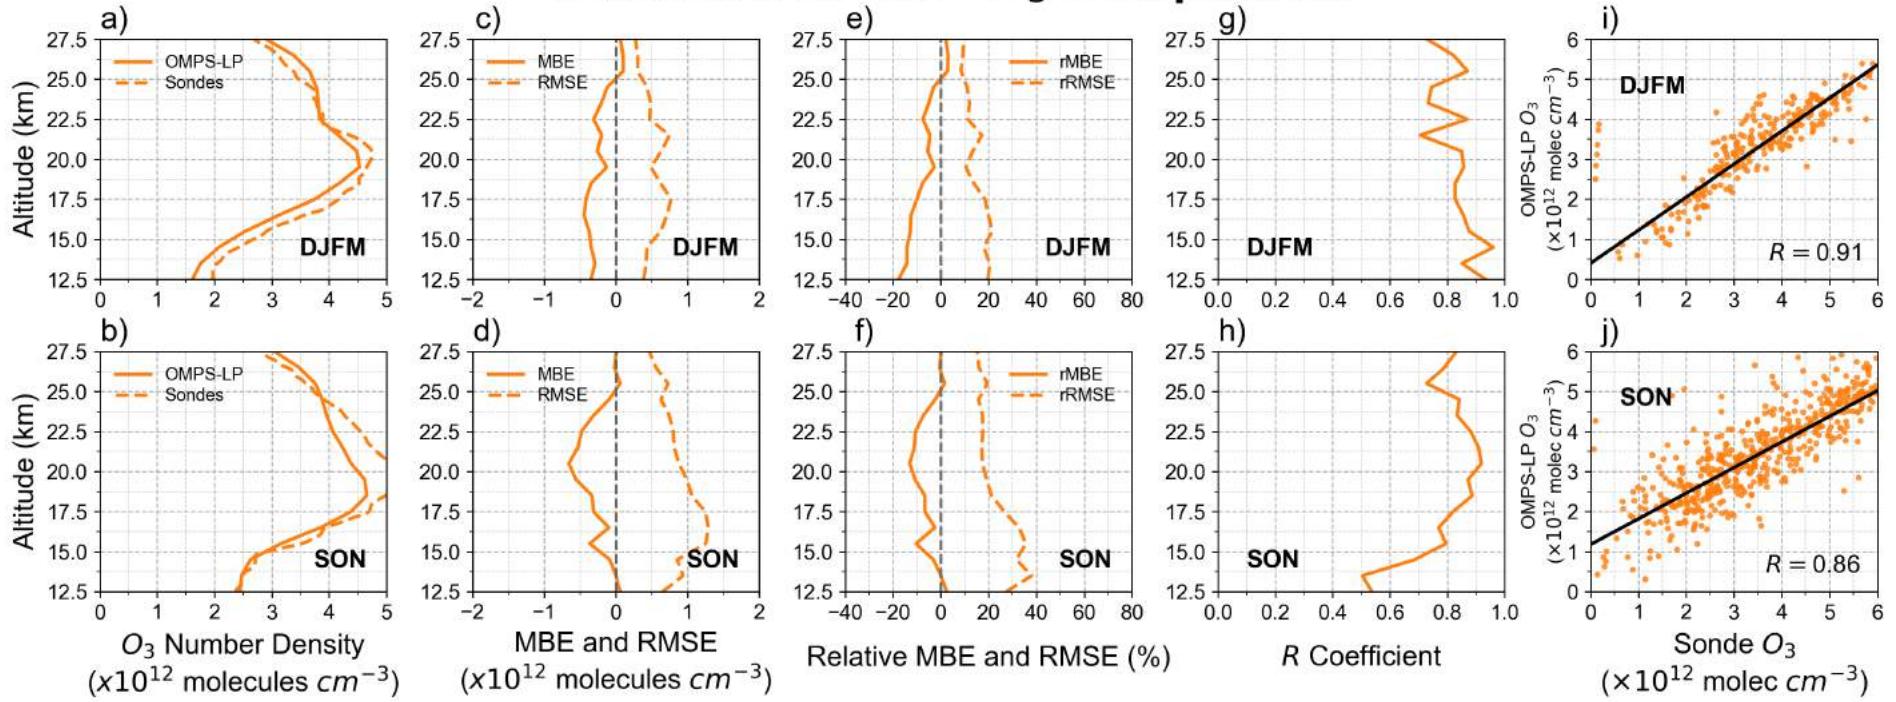

Fig. S14. Comparison between OMPS-LP-derived and balloon-borne data of ozone over the period DJFM 2013-2016 (first row) and over the period SON 2012-2018 (second row) for Dumont d'Urville Station.

- a-b) Mean profiles. The solid line stands for the MEAN computed from OMPS-LP-derived estimates of ozone and the dashed line stands for the MEAN computed from balloon-borne measurements of ozone. 16 and 37 ozone profiles were compared over the periods DJFM 2013-2016 and SON 2012-2018, respectively;
- c-d) Mean Bias Error (MBE, solid line) and Root Mean Square Error (RMSE, dashed line) relative to balloon-borne ozone data;
- e-f) Relative Mean Bias Error (rMBE, solid line) and Relative Root Mean Square Error (rRMSE, dashed line);
- g-h) R profile;
- i-j) Scatter plot (the correlation coefficient is shown in the plot).

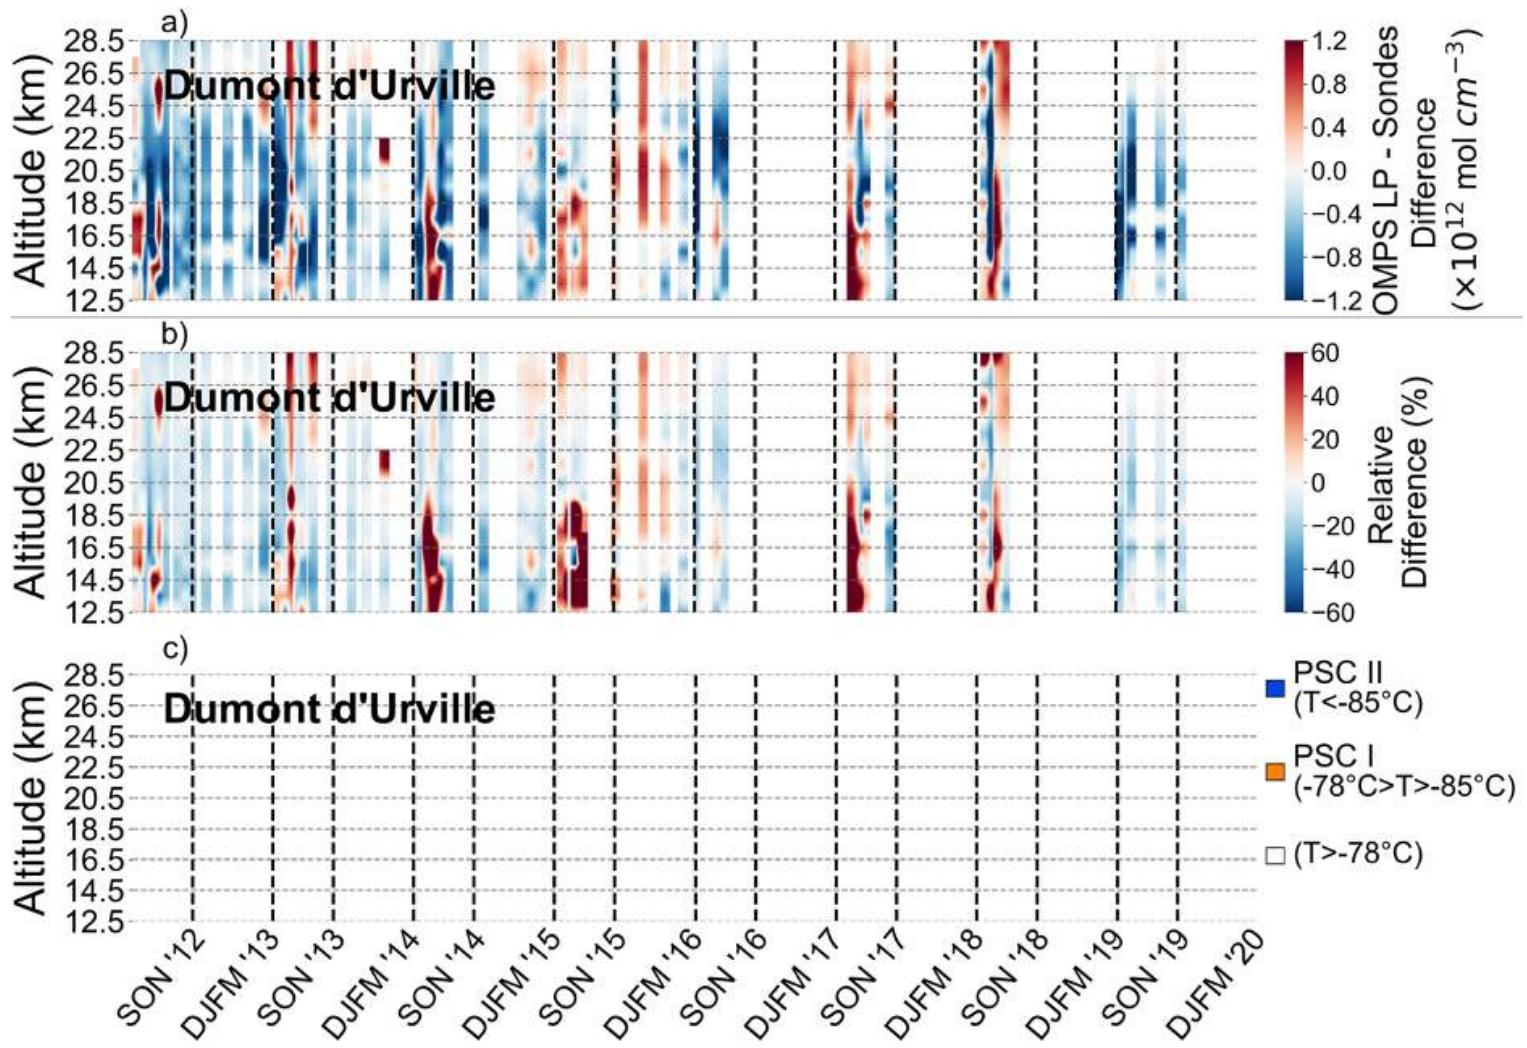

Fig. S15. Heatmap of the differences (absolute and relative) between OMPS-LP-derived estimates and balloon-borne measurements; blank spaces indicate periods within which no sondes fulfilling the comparison criteria were available. Periods and altitudes at which the temperature favors the formation of polar stratospheric clouds (PSC) are shown below the heatmaps; temperature profiles from sondes were used. Dashed lines separate different periods (DJFM and SON).

Dumont d'Urville

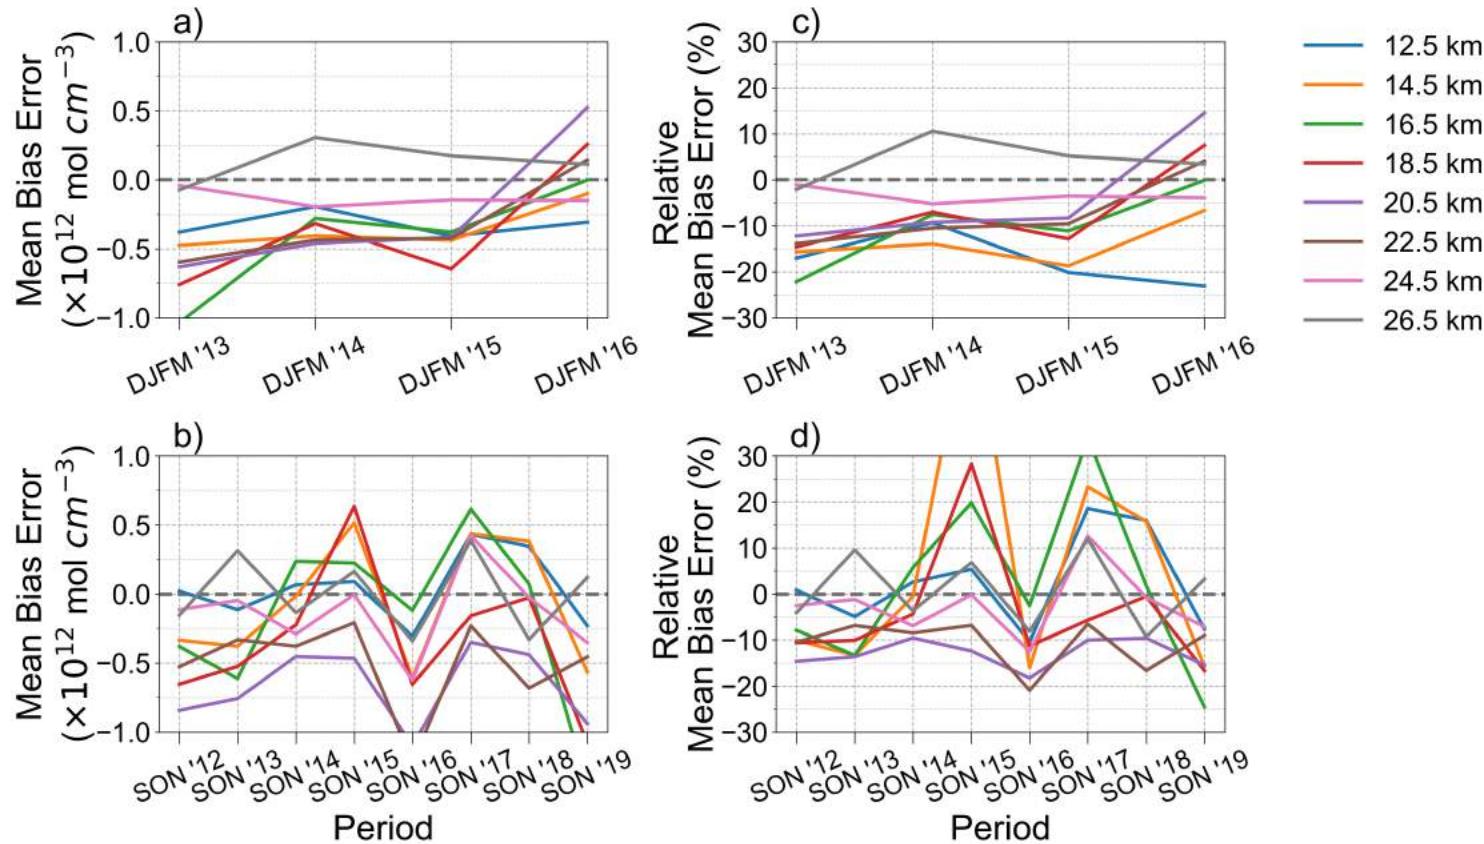

Fig. S16. Time series of the absolute and relative mean bias errors (*MBE*) of OMPS-LP-derived estimates of the ozone (relative to balloon-borne data) computed for Dumont d'Urville Station, over the DJFM period (first row) and over the SON period (second row).

Table S9. *R* coefficients between several OMPS-LP parameters (SZA, SSA, Reflectance, etc.) and the relative differences (between the OMPS-LP-derived estimates and the balloon-borne measurements of ozone) over the period DJFM 2013-2020. *R* coefficients higher than 0.2 and lower than -0.2 are in bold.

Amundsen-Scott - O_3 Comparison

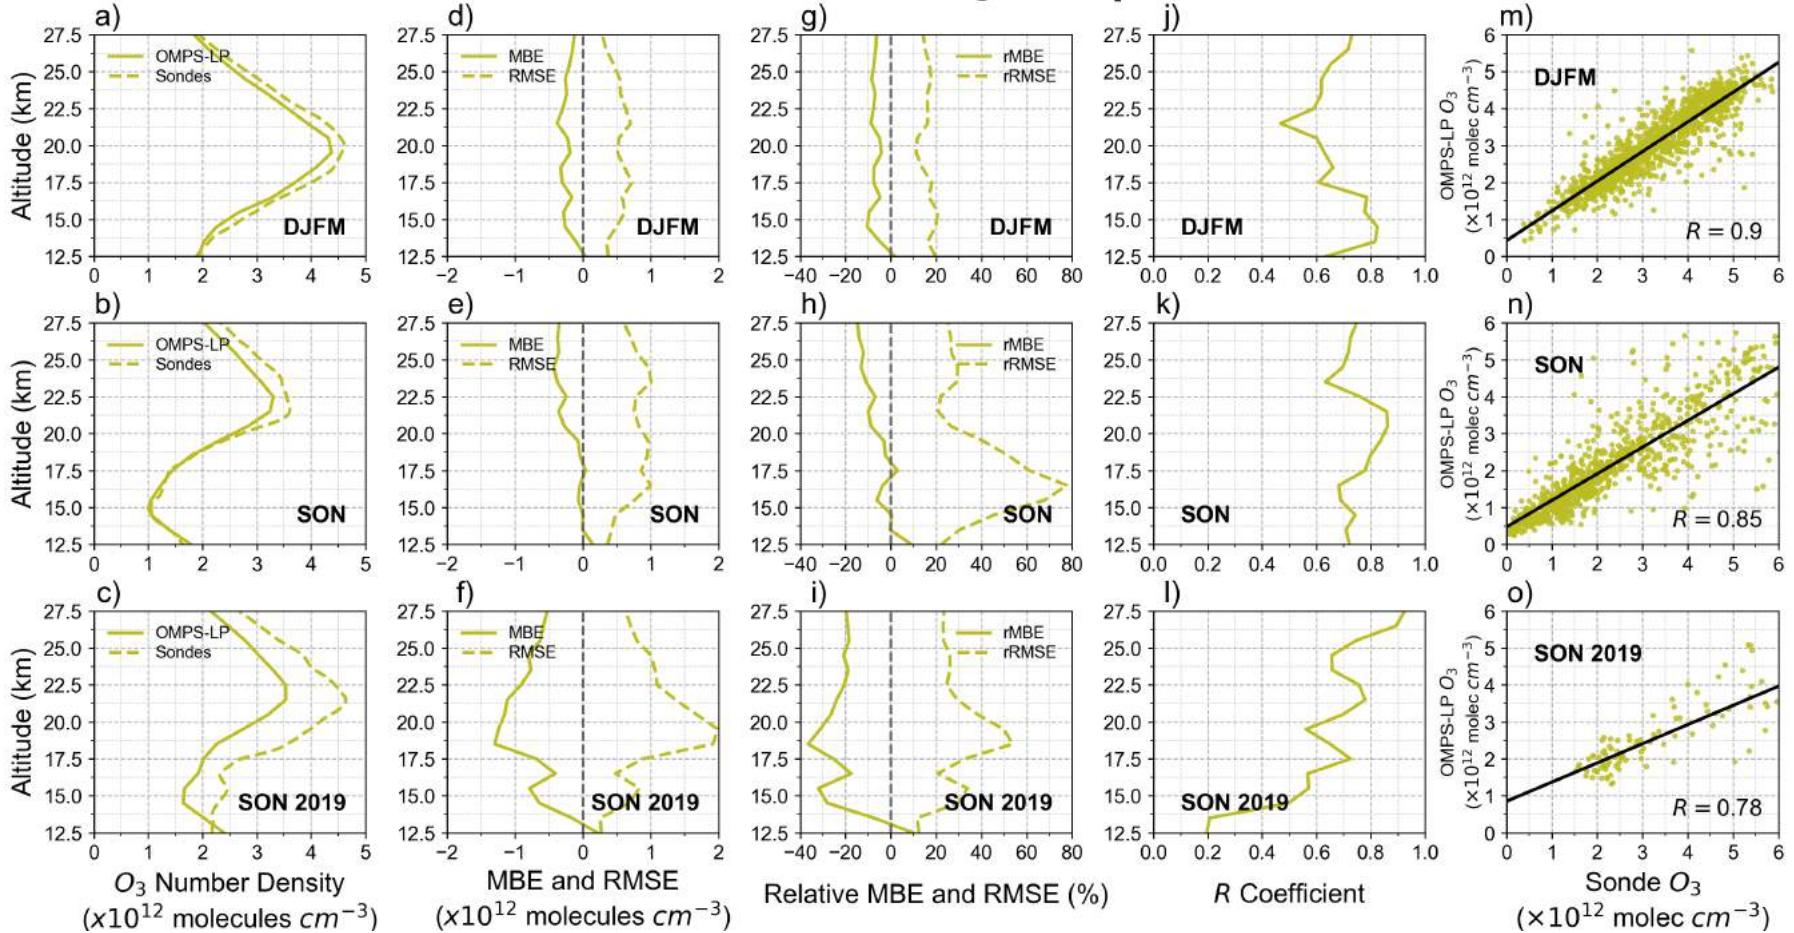

Fig. S17. Comparison between OMPS-LP-derived and balloon-borne data of ozone over the period DJFM 2013-2020 (first row), over the period SON 2012-2018 (second row) and over the period SON 2019 (third row) for Amundsen-Scott Station.

a-c) Mean profiles. The solid line stands for the MEAN computed from OMPS-LP-derived data of ozone and the dashed line stands for the MEAN computed from balloon-borne data of ozone. 74, 49 and 6 ozone profiles were compared over the periods DJFM 2013-2020, SON 2012-2018 and SON 2019, respectively;

d-f) Mean Bias Error (*MBE*, solid line) and Root Mean Square Error (*RMSE*, dashed line) relative to balloon-borne ozone data;

g-i) Relative Mean Bias Error (*MBE*, solid line) and Relative Root Mean Square Error (*RMSE*, dashed line);

j-l) *R* profile;

m-o) Scatter plot (the correlation coefficient is shown in the plot).

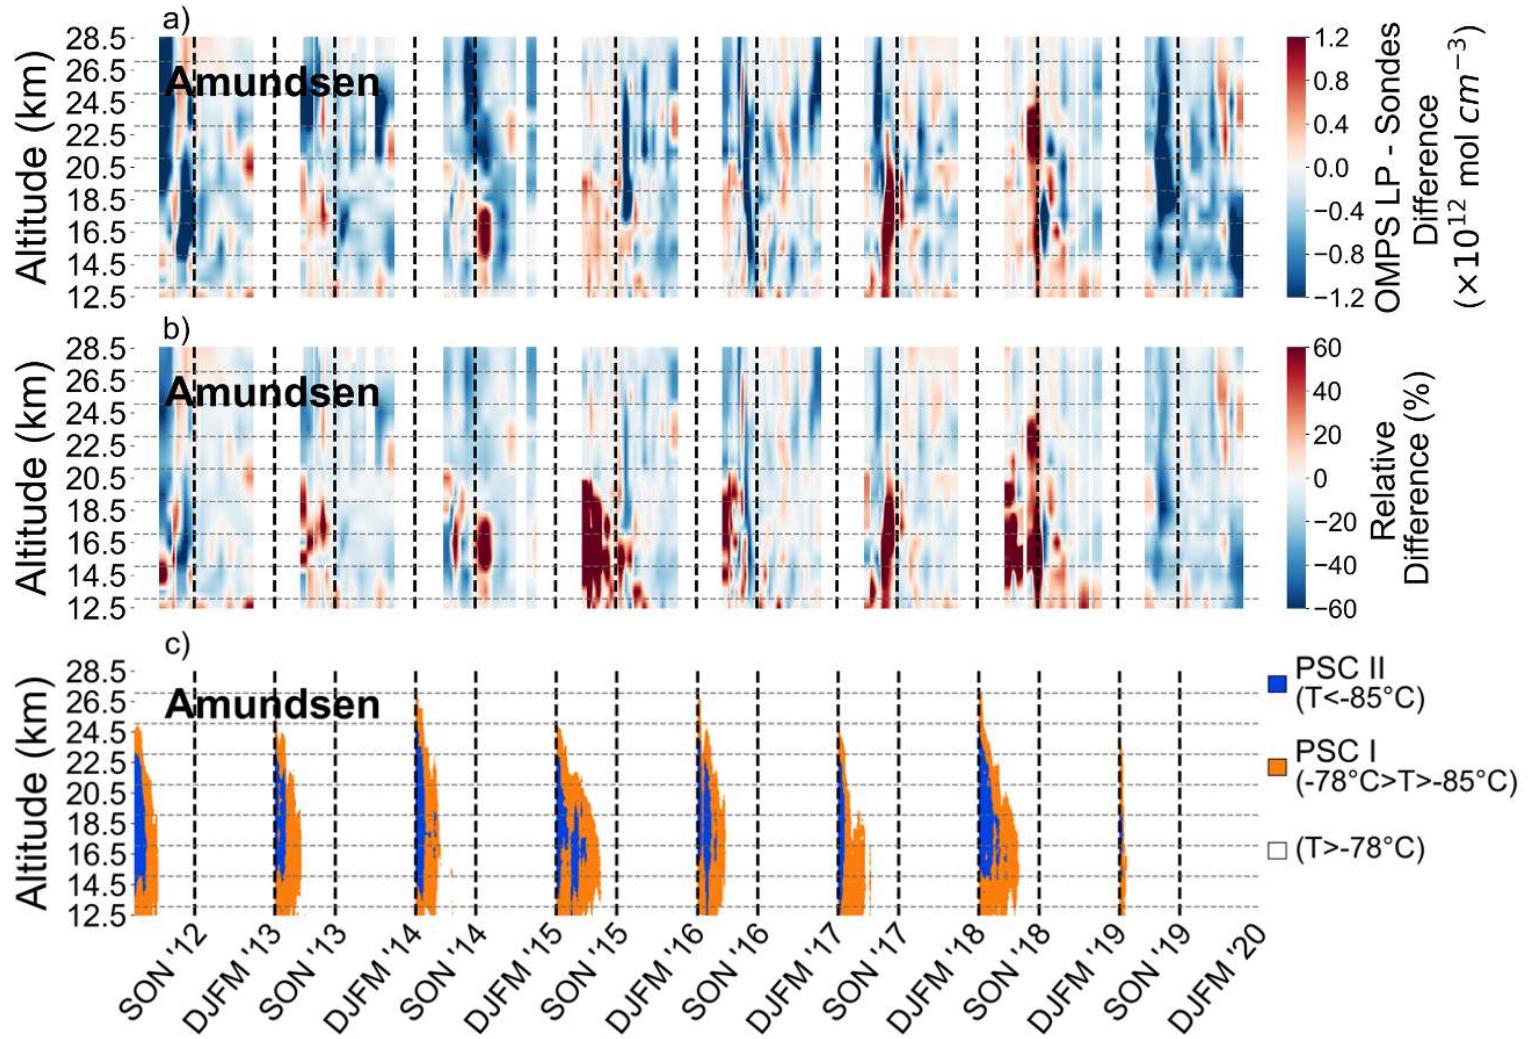

Fig. S18. Heatmap of the differences (absolute and relative) between OMPS-LP-derived estimates and balloon-borne measurements; blank spaces indicates periods within which no sondes fulfilling the comparison criteria were available. Periods and altitudes at which the temperature favors the formation of polar stratospheric clouds (PSC) are shown below the heatmaps; temperature profiles from sondes were used. Dashed lines separate different periods (DJFM and SON).
